

# SECURING OIL AND NATURAL GAS INFRASTRUCTURES IN THE NEW ECONOMY

This report, published by the National Petroleum Council, suggests actions for identifying and reducing infrastructure vulnerabilities to physical and cyber attacks within the oil and natural gas industries. It presents the case for moving forward in the new business environment, adopting critical infrastructure protection thinking as part of the foundation of acting in the best interests of a company. It identifies the issues and the steps forward that the oil and natural gas industries and the government will need to implement to ensure the integrity and continuity of the industries' infrastructure.

This report's recommendations are intended to be dynamic, reflecting the fact that the industry is in the midst of significant change. Even the understanding of critical infrastructure protection is still evolving. Energy infrastructures are inextricably linked with other critical infrastructures, and, as a result, the report takes a holistic perspective on critical infrastructure protection.

This study was requested by the Secretary of Energy. Final printed copies of the study are now available for purchase from NPC at a cost of \$15 per copy.
